Text Inspector - API version 2

Introduction

This document describes the current programmatic API (version 2) that is made available to some users of the Text Inspector product created by WebLingua.

The document is intended for a technical audience, and assumes an understanding of RESTful APIs, HTTPS, JSON and other technical details.

Further information

For more information or to discuss getting access to the Text Inspector API, please contact your WebLingua or Text Inspector account manager, or mail the Text Inspector help team: textinspectorhelpteam@gmail.com

Changes for API v2 compared to v1

1. JSON key names in the API responses have been changed to be consistently in camelCase syntax - previously there was a mixture of syntax styles used for the key names.
2. Friendly names have been added to all response values to aid in the understanding and presentation of results.
3. The “tiprofile” parser has been renamed “scorecard” to be consistent with the website.
4. A new “scorecardrating” method has been added to retrieve just the overall score card rating.
5. Version number in all request URLs changed from v1 to v2

Using the API

In order to use the API, if you haven’t already you will need to register on the main Text Inspector site and then request API access via the “API for Developers” page on the site.

Please do this by going to the following two links.

1. Text Inspector Registration: https://textinspector.com/account/register
2. Request API Access: https://textinspector.com/help/?page_id=974
**API URI**

The base URI for all API requests is:

https://textinspector.com/api/v2/

e.g.

GET https://textinspector.com/api/v2/createsession

---

**Text Analysis API flow**

To analyse a piece of text and obtain the analysis results for the different Text Inspector parsers requires multiple requests to be made to the API.

You first need to authenticate with the API to create a user session (createsession) and obtain a “sessionid”. That “sessionid” is then passed in all subsequent API requests.

During a session you can submit any number of texts for analysis - if you want to analyse multiple texts you do not need to create a new session for each.

Once you have a session you then submit your text for analysis. On successful submission of your text you will be returned what we call a “context id” (or “ctxId”). This context id is unique for that piece of texts analysis in your session, and is used for obtaining the analysis results from the different Text Inspector parsers.

Once you have a context id you would then request the results from the parser(s) that you are wanting the analysis results for.

An example flow of API requests might be:

1. Create session and obtain your “sessionid”
2. Submit new text for analysis and obtain the analysis “ctxId”
3. Get statistics parser results
4. Get tagger parser results
5. Submit second text for analysis and obtain the analysis “ctxId”
6. Get scorecard parser results
7. etc.
API methods

GET /api/v2/createsession

To use the API you need to first authenticate with the API to create a user session - doing this will return you a sessionid. That session ID needs to be remembered and passed as a cookie header to all subsequent requests in the session.

During a session you can analyse and get the results for any number of different texts.

To authenticate and get the Session ID you have to make a createsession API call

Authentication is done with HTTP Basic Authentication, and as such you can supply the username/password either inline in the URL, or in an “Authentication” HTTP header.

Inline username/password

e.g. https://username:password@textinspector.com/api/v2/createsession

When passing the username/password inline in the URL, both username and password need to be URL (percent) encoded.

e.g. the “@” in the email username needs to be encoded as “%40”.

In PHP for example you would use the urldecode() function to do this.

As an example, if your username was “test@example.com” and your password “abc!123” then these encoded and added inline to the createsession API URL would look like:

https://test%40example.com:abc%21123@textinspector.com/api/v2/createsession

Curl example

```
curl -X GET
"https://{urlencoded_username}:{urlencoded_password}@textinspector.com/api/v2/createsession" -H "accept: application/json" -L
```
“Authentication” HTTP header

To send the username/password in an “Authentication” HTTP header the username and password need to be concatenated with a colon (":") and then Base64 encoded.

e.g.

“test@example.com:abc!123" -> base64 encode -> “dGVzdEBleGFtcGxlLmNvbTphYmMhMTIz”

The resulting encoded string is added as an http “Authorization” header to your request, with the value being “Basic [encoded_string]”.

e.g.

Authorization: Basic dGVzdEBleGFtcGxlLmNvbTphYmMhMTIz

Curl example

```bash
```

The response from a createsession API call will return you a "sessionid".

Example response

```json
{
    "sessionid" : "731999172284994221689694364605242328"
}
```

This "sessionid" should be stored and needs to be passed in all subsequent requests during your session as a “textinspector.session” cookie http header.

E.g.

Cookie: textinspector.session={sessionid};
POST /api/v2/newanalysis

Submit a document for processing.

You can submit one or multiple texts at the same time. If submitting multiple texts then they should be separated by a “delimiter” character (specified in the request, defaulting to “#”), and the “split” parameter should be set to “1”.

The “newanalysis” API call returns a **ctxId** and the count of the number of documents processed. Use the **ctxId** and appropriate document number(s) in subsequent requests to get results from different parsers.

**Curl example**

```bash
curl -X POST "https://textinspector.com/api/v2/newanalysis" -H "Content-Type: application/json" -H "accept: application/json" -H "Cookie: textinspector.session={sessionid};" -L --data '{"text":"Try+the+tool+out+with+this+paragraph+of+text+or+you+can+replace+this+whole+text+with+some+text+of+your+choosing.%23This+is+a+second+document","delimiter":%23,"split":"1","textmode":"Writing"}
'
```

**Example response**

```json
{
    "response" : {
        "ctxId" : "AFD52E08-4DD5-11E8-9E8C-26C6F64FBF04",
        "doc_count" : 2,
        "resultType" : "api_start",
        "errors" : []
    },
    "name" : "api_start",
    "type" : "api_start"
}
```
Having submitted a document for processing, you can then request results from the different parsers.

To do this use the `ctxId` returned from the newanalysis POST and specify which document number that you’d like to parse.
Note: if you submitted a single text then the document number that you use in all other API calls will always be “1”. If however you submitted multiple texts with a delimiter character then the document numbers will allow you to get the parser results for each of the separate documents.

E.g.

First text#second text#third text

Results in 3 documents
doc1#doc2#doc3

GET /api/v2/{ctxID}/doc{docNum}/statistics

Get the results for the “Statistics” parser

<table>

                "friendlyName" : "Spelling errors per sentence",
                "value" : "0.17"
            },
            "perHundredWords" : {
                "value" : "1.00",
                "friendlyName" : "Spelling errors per 100 words"
            }
        },
        "spellingErrors" : [
            "Analyse"
        ]
    }
}
GET /api/v2/{ctxID}/doc{docNum}/diversity

Get the results for the “Lexical Diversity” parser.

**Curl example**

curl -X GET
"https://textinspector.com/api/v2/{ctdId}/doc{docNum}/diversity" -H
"accept: application/json" -H "Cookie: textinspector.session={sessionid};" -L

**Example response - diversity**

```json
{
    "exists": 1,
    "response": {
        "ctxId": "13C2AB3E-9C1D-11E9-AB5C-DDF6D7F2BACF",
        "lexicalDiversity": {
            "friendlyName": "Lexical Diversity",
            "vocd": {
                "value": "79.91",
                "friendlyName": "VOCD Lexical Diversity"
            }
        }
    }
}
```
GET /api/v2/{ctxID}/doc{docNum}/tagger

Get the results for the “Tagger” parser.

Curl example

curl -X GET
"https://textinspector.com/api/v2/{ctxID}/doc{docNum}/tagger" -H
"accept: application/json" -H "Cookie:
textinspector.session={sessionid};" -L

Example response - tagger

{
   "type" : "tagger",
   "name" : "Tagger",
   "exists" : 1,
}
"response" : {
    "documentId" : "doc1",
